

Transactions Knowledge Base

This document provides sample information about transaction processing, fees, refunds, disputes, and security for demo chatbot testing. The examples below are illustrative and intended for local development only.

1. What is a transaction?

A transaction is any movement of money in or out of a customer account. This includes debit card purchases, ATM withdrawals, salary deposits, bill payments, wire transfers, merchant refunds, and account-to-account transfers.

Transactions may appear as pending, in process, or completed depending on the payment channel and settlement time.

2. Transaction status lifecycle

- **Pending:** The transaction has been authorized or submitted but has not fully settled yet.
- **Posted:** The amount is now reflected in the account balance after confirmation.
- **Failed:** The payment could not be processed and no funds were moved.
- **Reversed:** A prior transaction was canceled or reversed by the bank or merchant.

3. Card transaction processing

Card payments often appear as pending immediately after a purchase. The merchant submits the transaction for settlement and the bank finalizes the posting within one to three business days.

If a purchase is disputed or canceled, the bank may place a temporary hold while reviewing the transaction details.

4. Fees and limits

Domestic transfers are usually faster and cheaper than international transfers. International transactions may involve currency conversion and foreign exchange fees.

ATM withdrawals outside the bank network may incur a surcharge, and daily limits may apply to cash withdrawals, transfers, or card spends depending on the account type.

5. Refunds and disputes

Refunds normally return to the original payment method. The timeline depends on the merchant and the payment processor, but customers can expect several business days for the amount to become visible.

If a customer reports an unauthorized or incorrect transaction, the bank may review the merchant details, timestamps, and account activity before deciding on a temporary credit or dispute resolution.

6. Security and alerts

Unusual spending patterns may trigger a fraud alert. In such cases, the customer may receive a verification request before the transaction is approved or declined.

Customers should never share one-time passwords (OTPs), card verification codes, or login credentials with anyone, even if the request appears to be from the bank.

7. Demo questions

- Why is my debit card transaction showing as pending?
- How long does it take for a transfer to post to my account?
- What fees apply to international purchases?
- How do I know if a transaction is fraudulent?

- What happens if a merchant refunds my purchase?
- Can I dispute a charge that I do not recognize?
- Why did my ATM withdrawal have an extra fee?
- Are there limits on daily card spending or transfers?

8. Summary

This knowledge base is intended to help answer common transaction questions in a secure, factual, and customer-friendly manner during demo testing.
